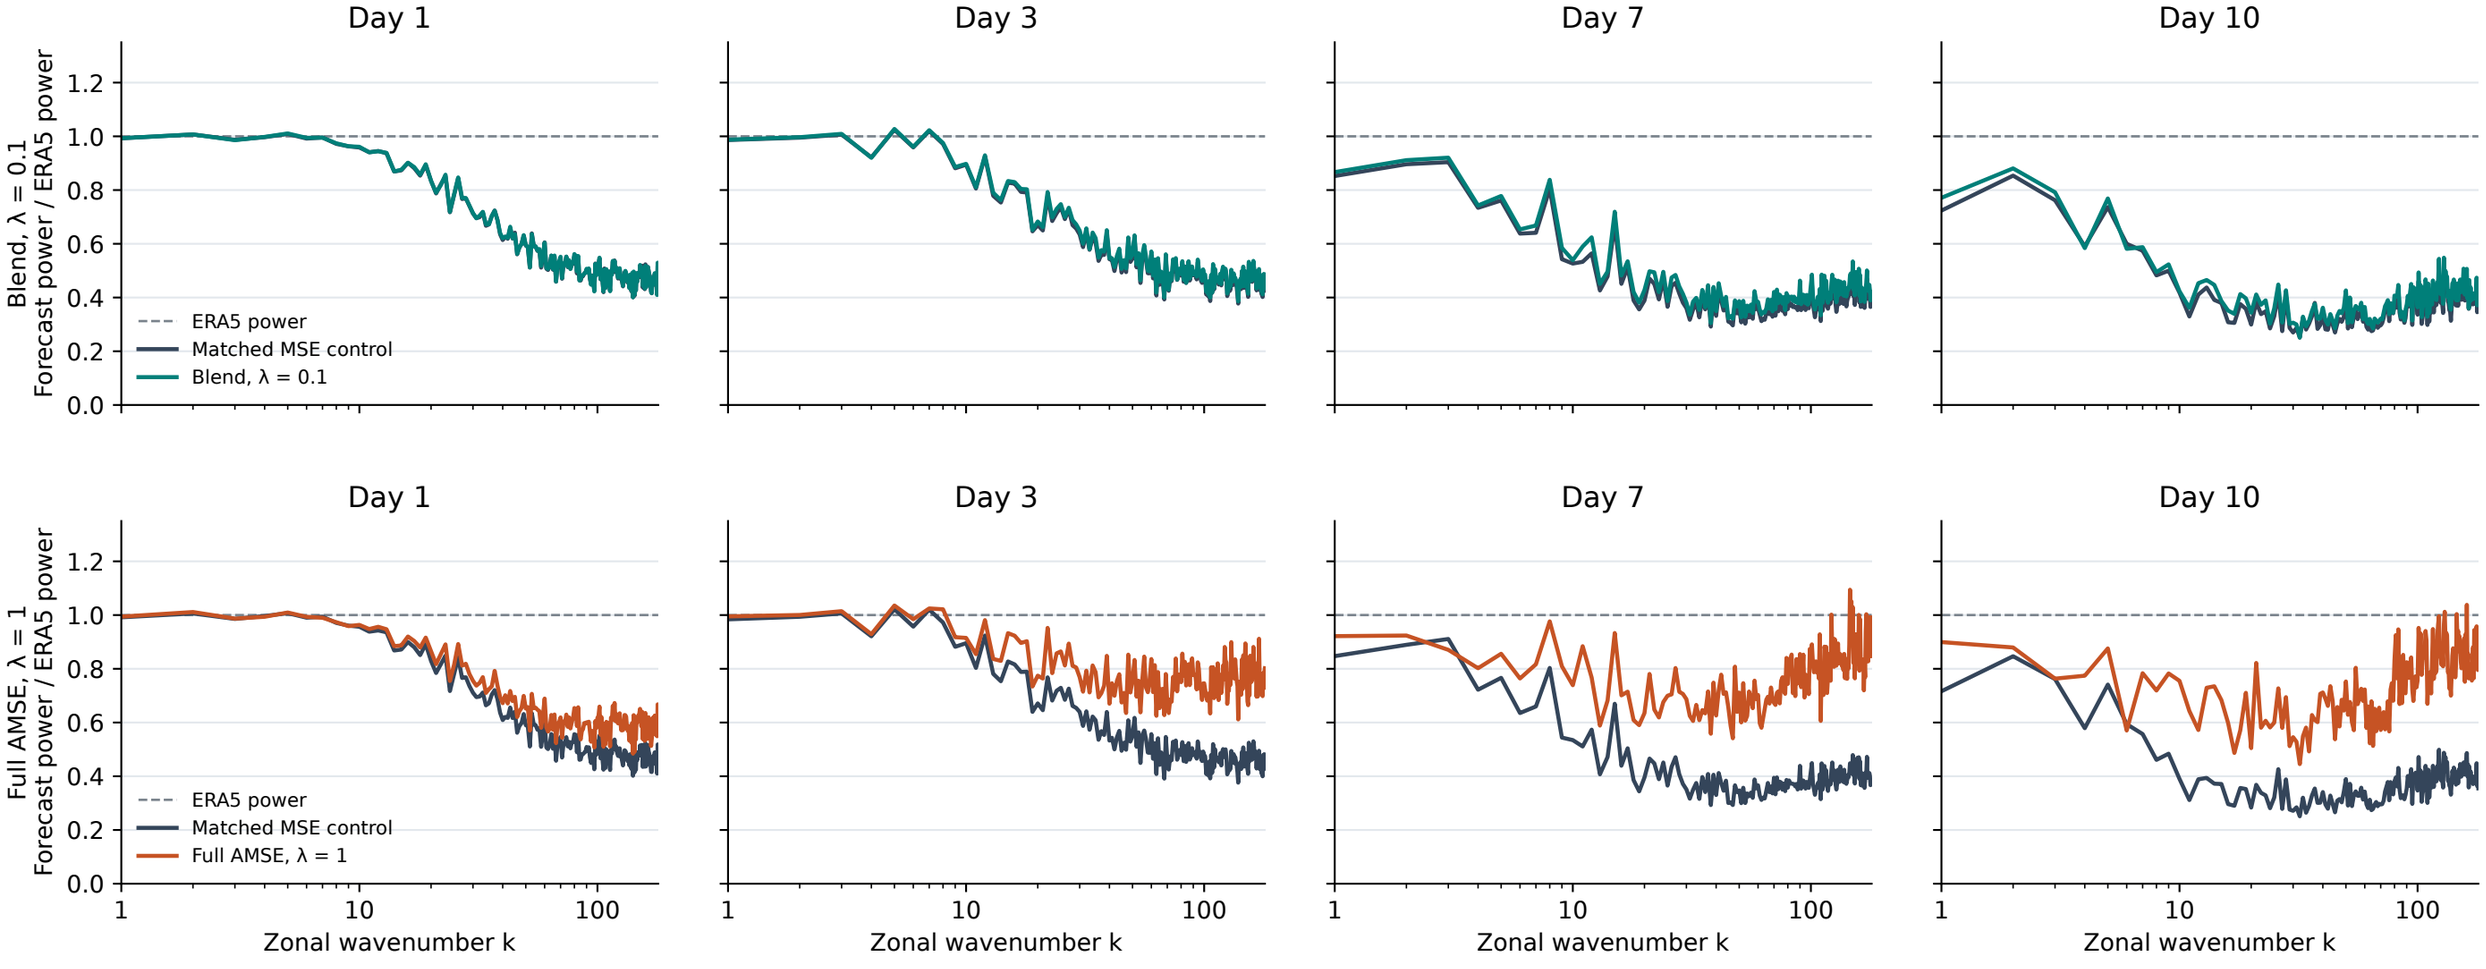
Temperature at 850 hPa: how much ERA5 spectral power is retained?

Normalized zonal power · ideal = 1 · below 1 indicates a power deficit · SWA, 8 pooled 2023 starts



30–60° latitude bands in both hemispheres. Curves are unsmoothed. T850 is the example field used in the existing experiment report.

Closer power does not imply correct phase or lower forecast error; full AMSE loses deterministic skill in the matched evaluation.
